

What's New in CA Wily Introscope® 8

WHAT'S NEW

- Increased scalability
- Unified support for Java and .NET
- Web Services performance management
- Increased Web Services transaction visibility
- Point-and-click agent installers
- Faster root-cause analysis
- Significant ease-of-use improvements
- Expanded platform support for JBoss and 64-bit platforms

Key New Features in CA Wily Introscope® 8

Increased Scalability:

CA Wily Introscope® 8 enables you to manage five times as many applications in clustered environments and two times as many applications in standalone environments. Customers in standalone environments can achieve the 2x scalability without purchasing new hardware. This enables you to confidently deliver the new applications and services your business needs to grow, while reducing total cost of ownership. Additionally, large-scale deployments now have a single-pane-of-glass interface into the entire managed environment, providing one point of administration to unify, simplify and streamline management.

Unified Java and .NET Support:

Introscope 8 provides support for both Java and .NET environments in a single, fully integrated product.

Web Services Performance Management:

CA Wily Web Services Manager is now included with Introscope 8. This enables you to monitor critical Web Services around the clock, detect problems proactively and perform root-cause analysis when issues arise. It also provides complete Web Services transaction visibility by gathering data from multiple applications that span the business process, resulting in better insight into overall transaction performance.

Rapid Deployment:

Point-and-click agent installers make Introscope 8 fast and easy to deploy across all platforms and operating systems. Within minutes, you can monitor any Java or .NET web application in your environment to improve performance and availability and accelerate time to value. If you currently use Introscope, you can upgrade to the Introscope 8 Enterprise Manager within minutes and all of your management modules and configurations are automatically migrated.

Enhanced Usability:

An updated user interface and dashboard graphics make it fast and easy to triage and diagnose critical performance incidents. Other top-requested usability enhancements also are included, making Introscope even easier to use and manage in your environment.

Expanded Platform Support:

Introscope 8 offers deep visibility into JBoss, 64-bit platforms and virtual systems for faster triage and diagnosis in these environments.

Increased Solution Value:

With Introscope 8, CA Wily has simplified the packaging of our complete Application Performance Management suite by including Introscope PowerPacks and Extensions as part of the standard product. Existing customers on active maintenance will have access to Introscope 8 and the Introscope PowerPacks and Extensions free of charge—without any changes to your current maintenance costs.

Full details on what's in Introscope 8 are included in the release notes, available with the product download and from CA Wily Technical Support. All customers on active maintenance are automatically entitled to access Introscope 8. Please contact CA Wily Technical Support to obtain download links.
